Research Topic:

SafeSight. To create a physical system that can take in images from fisheye cameras, process it, and then using models to check for any dangerous situations. That would mean the system would be have blindspot detection, rear and forward collision warning, lane drift warning, and a screen that could display position of other cars relative to the main car and be the warning system.

Monday Feb 2nd

Used gray filter and canny edge detection on the masked images, so that later I can detect the lane markings and make the zone in which the lane behind is.

Timeline

Date	Goal	Met?
Today minus 2 weeks	Collision warning	Done
Today minus 1 week	Do lane detection	In progress
This week	Create the area for the lane based off the lane markings	TBD
Today plus 1 week	Detect distances of cars/find dataset with continous frames	TBD
Today plus 2 weeks	Finish up collision warning	TBD

Reflection

I was not able to complete my goal for this week, which was to detect the lanes. Though, I was able to get it all set up so it should be done quickly this week.
