Research Topic:

SafeSight. To create a physical system that can take in images from fisheye cameras, process it, and then using models to check for any dangerous situations. That would mean the system would be have blindspot detection, rear and forward collision warning, lane drift warning, and a screen that could display position of other cars relative to the main car and be the warning system.

Snow Goal

By the break, I want to have tested the blindspot detection on the Raspberry Pi to make sure it can run it properly, and adapt whatever needs to be changed. This is because most likely I will have to choose to only detect every few frames, and this before I test so there are porbably a dozen other issues I will have to look at.

Tuesday November 25th

I read up on more articles and sources on the raspberry pi, and if there would be any issues with its computational power with what I am trying to solve.

Timeline

Date	Goal	Met?
Today minus 2 weeks	Blindspot detection	Done
Today minus 1 week	Blindspot detection	Done
This week	Setting up Raspberry Pi	In progress
Today plus 1 week	Setup & start testing	
Today plus 2 weeks	Keep working with the Pi	

Reflection

I believe I completed the November goal even if it wasn't what I planned would happen. This is because I knew that after finishing the blindspot zone the next step was testing, and after this week I think I am at a comfortable position to start testing.
