Research Topic:

SafeSight. To create a physical system that can take in images from fisheye cameras, process it, and then using models to check for any dangerous situations. That would mean the system would be have blindspot detection, rear and forward collision warning, lane drift warning, and a screen that could display position of other cars relative to the main car and be the warning system.

Final Product

As a final polish for the showcase, I want the Raspberry Pi to run all the systems and output a centralized display. I'm picturing a UI like the Tesla dashboard that models the surrounding cars in real-time. Although I don't know how to do it, I expect to have enough time to learn and build it right after I wrap up the lane departure feature.

Timeline

Date	Goal	Met?
Today minus 2 weeks	Detect distances of cars/find dataset with continous frames	Done
Today minus 1 week	Finish up collision warning	Done
This week	Finish up if needed/start working on lane drift	Done
Today plus 1 week	work on lane drift	TBD
Today plus 2 weeks	Work on lane drift	TBD
